[REFCARD] Value Stream Management **Essentials**

Value Stream Management (VSM) is the practice of monitoring, evaluating, and improving an organization's software d process Download the Refcard to lear...

Introduction

In my last article (https://dzone.com/articles/build-and-install-hadoop-on-windowswith-native-bi), we covered setting up and using Hadoop. This article is all about configuring and starting an Apache Kafka server on a Windows OS. This guide will also provide instructions to set up Java and Apache ZooKeeper.

Apache Kafka is a fast and scalable messaging queue, capable of handling heavy loads in context of read and write, i.e. IO-related, stuff. You can find more about Kafka on http://kafka.apache.org/ (http://kafka.apache.org/). Apache Kafka requires a running ZooKeeper instance, which is used for reliable distributed coordination. Please find more about ZooKeeper on https://zookeeper.apache.org/

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES ~

Author's GitHub:

I have created a bunch of Spark-Scala utilities at https://github.com/gopal-tiwari (https://github.com/gopal-tiwari), might be helpful in some other cases.

Downloading the Required Files

- Download Server JRE according to your OS and CPU architecture from http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html (http://www.oracle.com/technetwork/java/javase/downloads/jre8-downloads-2133155.html)
- Download and install 7-zip from http://www.7-zip.org/download.html (http://www.7-zip.org/download.html)
- Download and extract ZooKeeper using 7-zip from http://zookeeper.apache.org/releases.html
 (http://zookeeper.apache.org/releases.html)
- Download and extract Kafka using 7-zip from http://kafka.apache.org/downloads.html

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES ~

urre, but you can unzip uicin in any iocauon.

Here, we are using full-fledged ZooKeeper and not the one packaged with Kafka because it will be a single-node ZooKeeper instance. If you want, you can run Kafka with a packaged ZooKeeper located in a Kafka package inside the \kafka\bin\windows directory.

Installation

A. JDK Setup

1. Start the JRE installation and hit the "Change destination folder" checkbox, then click 'Install.'

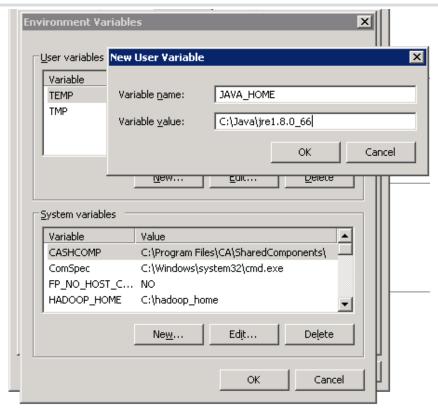

- 2. Change the installation directory to any path without spaces in the folder name. E.g. C:\Java\jre1.8.0_xx\. (By default it will be C:\Program Files\Java\jre1.8.0_xx), then click 'Next.'
- 3. Now open the system environment variables dialogue by opening Control Panel -> System -> Advanced system settings -> Environment Variables.
- 4. Hit the New User Variable button in the User variables section, then type JAVA_HOME in *Variable name* and give your jre path in the *Variable value*. It should look like the

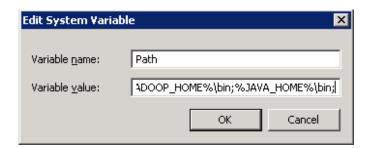

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES ~

(Java path and version may change according to the version of Kafka you are using)

- 5. Now click OK.
- 6. Search for a Path variable in the "System Variable" section in the "Environment Variables" dialogue box you just opened.
- 7. Edit the path and type ";%JAVA_HOME%\bin" at the end of the text already written there, just like the image below:

8. To confirm the Java installation, just open cmd and type "java –version." You should be able to see the version of Java you just installed.

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES ~

If your command prompt somewhat looks like the image above, you are good to go. Otherwise, you need to recheck whether your setup version matches the correct OS architecture (x86, x64), or if the environment variables path is correct.

B. ZooKeeper Installation

- 1. Go to your ZooKeeper config directory. For me its *C:\zookeeper-3.4.7\conf*
- 2. Rename file "zoo_sample.cfg" to "zoo.cfg"
- 3. Open zoo.cfg in any text editor, like Notepad; I prefer Notepad++.
- 4. Find and edit dataDir=/tmp/zookeeper to :\zookeeper-3.4.7\data
- 5. Add an entry in the System Environment Variables as we did for Java.
- a. Add ZOOKEEPER_HOME = C:\zookeeper-3.4.7 to the System Variables.
- b. Edit the System Variable named "Path" and add ;%ZOOKEEPER_HOME%\bin;
- 6. You can change the default Zookeeper port in zoo.cfg file (Default port 2181).
- 7. Run ZooKeeper by opening a new cmd and type zkserver.
- 8. You will see the command prompt with some details, like the image below:

```
Command Prompt - zkserver
                                         [main:Environment@100] - Server
     .name=Windows Server 2008
2-31 15:21:04,609 [myid:]
                                         [main:Environment@100] - Server environm
           5:21:04,609 [myid:] - INFO
                                         [main:Environment@100] - Server environm
          15:21:04,609 [myid:] - INFO
                                         [main:Environment@100] - Server environm
          15:21:04,609 [myid:] - INFO
                                         [main:Environment@100] - Server environm
                                         [main:Environment@100] - Server environm
                                         [main:ZooKeeperServer@785] - tickTime
          15:21:04,671 [myid:] - INFO
                                         [main:ZooKeeperServer@794] - minSessionT
           15:21:04,671 [myid:] - INFO
                                         [main:ZooKeeperServer@8031 - maxSessionT
                                          [main:NIOServerCnxnFactory@891 - binding
        0.0.0.0/0.0.0.0:2181
```

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES ~

- 1. Go to your Kafka config directory. For me its C:\kafka_2.11-0.9.0.0\config
- 2. Edit the file "server.properties."
- 3. Find and edit the line log.dirs=/tmp/kafka-logs" to "log.dir= C:\kafka_2.11-0.9.0.0\kafka-logs.
- 4. If your ZooKeeper is running on some other machine or cluster you can edit "zookeeper.connect:2181" to your custom IP and port. For this demo, we are using the same machine so there's no need to change. Also the Kafka port and broker.id are configurable in this file. Leave other settings as is.
- 5. Your Kafka will run on default port 9092 and connect to ZooKeeper's default port, 2181.

D. Running a Kafka Server

Important: Please ensure that your ZooKeeper instance is up and running before starting a Kafka server.

- 1. Go to your Kafka installation directory: C:\kafka_2.11-0.9.0.0\
- 2. Open a command prompt here by pressing *Shift + right click* and choose the "Open command window here" option).
- 3. Now type .\bin\windows\kafka-server-start.bat
- .\config\server.properties and press Enter.
 - $1 \hspace{0.1in} \verb|.\bin\windows\kafka-server-start.bat|. \verb|.\config\server.properties|$

```
C:\kafka_2.11-0.9.0.0>.\bin\windows\kafka-server-start.bat .\config\server.properties_
```

4. If everything went fine, your command prompt will look like this:

```
GroupCoordinator)
[2016-01-01 15:40:12,4041 INFO [ExpirationReaper-0], Starting (kafka.server.DelayedOperationPurgatory$ExpiredOperationReaper)
[2016-01-01 15:40:12,435] INFO [Group Metadata Manager on Broker 0]: Removed 0 expired off
```

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES >

```
ChangeListener)
[2016-01-01 15:40:12,529] INFO [ThrottledRequestReaper-Fetch], Starting (kafka.server.ClientQuotaManager$ThrottledRequestReaper)
[2016-01-01 15:40:12,545] INFO Creating /brokers/ids/0 (is it secure? false) (kafka.utils.ZKCheckedEphemeral)
[2016-01-01 15:40:12,560] INFO Result of znode creation is: OK (kafka.utils.ZKCheckedEphemeral)
[2016-01-01 15:40:12,576] INFO Registered broker 0 at path /brokers/ids/0 with addresses:
PLAINIEXT -> EndPoint' .9092, PLAINIEXI) (kafka.utils.ZkUtils)
[2016-01-01 15:40:12,571] INFO Kafka version : v.7.0.0 (org.apache.kafka.common.utils.AppInfoParser)
[2016-01-01 15:40:12,591] INFO Kafka commitId : fc7243c2af4b2b4a (org.apache.kafka.common.utils.AppInfoParser)
[2016-01-01 15:40:12,591] INFO [Kafka Server 0], started (kafka.server.KafkaServer)
[2016-01-01 15:50:12,418] INFO [Group Metadata Manager on Broker 0]: Removed 0 expired off sets in 0 milliseconds. (kafka.coordinator.GroupMetadataManager)
```

5. Now your Kafka Server is up and running, you can create topics to store messages. Also, we can produce or consume data from Java or Scala code or directly from the command prompt.

E. Creating Topics

- 1. Now create a topic with the name "test" and a replication factor of 1, as we have only one Kafka server running. If you have a cluster with more than one Kafka server running, you can increase the replication-factor accordingly, which will increase the data availability and act like a fault-tolerant system.
- 2. Open a new command prompt in the location $C: \kafka_2.11-0.9.0.0 \bin\windows.$
- 3. Type the following command and hit Enter:

```
1 kafka-topics.bat --create --zookeeper localhost:2181 --replication-factor 1 --partitions 1 --

C:\Windows\system32\cmd.exe

C:\kafka_2.11-0.9.0.0\bin\windows\kafka-topics.bat --create --zookeeper localhost:2181 --replication-factor 1 --partitions 1 --topic test

C:\kafka_2.11-0.9.0.0\bin\windows\
```

F. Creating a Producer and Consumer to Test Server

- 1. Open a new command prompt in the location *C:\kafka_2.11-0.9.0.0\bin\windows*
- 2. To start a producer type the following command:

```
1 kafka-console-producer.bat --broker-list localhost:9092 --topic test
```

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES ~

4. Now start a consumer by typing the following command:

Before kafka version 2.0 (<2.0):

1

After kafka version 2.0 (>= 2.0):

kafka-console-consumer.bat --bootstrap-server localhost:9092 --topic test

5. Now you will have two command prompts, like the image below:

6. Now type anything in the producer command prompt and press Enter, and you should be able to see the message in the other consumer command prompt.

```
Kafka-console-producer.bat --broker-list localhost:9092 --topic test

C:\kafka_2.11-0.9.0.0\bin\windows>kafka-console-producer.bat --broker-list localhost:9092
--topic test
Hi
My First Kafka Message
```

REFCARDZ (/refcardz) RESEARCH (/research) WEBINARS (/webinars) ZONES ~

7. If you are able to push and see your messages on the consumer side, you are done with Kafka setup.

Some Other Useful Commands

- 1. List Topics: kafka-topics.bat --list --zookeeper localhost:2181
- 2. Describe Topic: kafka-topics.bat --describe --zookeeper localhost:2181 -topic [Topic Name]
- 3. Read messages from the beginning
 - a. Before version < 2.0: kafka-console-consumer.bat --zookeeper localhost:2181 --topic [Topic Name] --from-beginning
 - b. After version > 2.0: kafka-console-consumer.bat --bootstrap-server
 localhost:9092 --topic [Topic Name] --from-beginn
- 4. Delete Topic: kafka-run-class.bat kafka.admin.TopicCommand --delete -- topic [topic_to_delete] --zookeeper localhost:2181

Topics: KAFKA, ZOOKEEPER, WINDOWS, BIG DATA, JAVA
